Young Kim  
Application #-10/612,778

To whom it may concern,

In response to the office action received on September 7, 2005, I mailed the explanation on September 30, 2005, 11:24 A.M. as a registered mail to the examiner, Stephanie L. Willatt. The mail was delivered to the office on October 3, 2005, and was confirmed and signed by a worker from that office. However, upon checking the status of my application, I contacted the examiner on Jan 13, 2006, and was told that there is no record of the response I submitted. Although the loss of the letter is not of my fault, I was advised by Stephanie to send \$265 for the 2 months late fee, just in case the office may find my evidence insufficient.

\*Please, waive my late fee and do not cash the check if the evidence is sufficient or I am not accountable for this delay.

\*Nevertheless, cash the check if the office finds my evidence insufficient. In that case, please, send me the letter of explanation why I am still accountable for the fee.

This letter includes:

1. Explanation for the delayed response.
2. Request for the fee waver
3. Photocopies of the receipts
4. Certificate of mailing
5. Response to the office action received on September 7, 2005.
6. \$265 check

#### Certificate of Mailing

I hereby certify that this correspondence is being deposited with the United States Postal Service with sufficient postage as first class mail in an envelope addressed to:

To whom it may concern,

Applicant, Jin young Kim, for a numerous years, has pursued his studies on ideal and practical designs of hair coloring applicators. Although he submitted an application titled “Nozzle Comb” on July 8, 2002, his application has not been granted a patent by the U.S. Patent Department because Patent Department has neglected to look at hair fluids’ general components and tendency, and focused only on applicator’s appearance.

I have tested various patented applicators by applying various coloring creams and fluids to duplicated applicators. In this experiment, I found one disturbing fact that fluid dispersing holes were frequently blocked by solidified fluids. Through my research, I concluded that the quick solidification of hair fluid is mainly due to the large glue component of hair fluid.

#### General Components of Hair Coloring Fluid

1. Lacquer- Hair fluid contains about 6% of natural lacquer extract that lacquer extract allows dye to penetrate into hair.
2. Coloring Matter-Hair fluid contains about 10% of this component
3. Glue-Hair fluid contains about 84% of glue.

#### Crucial role of Glue in determining applicator’s practicality

-Glue does not solidify in the absence of air. However, once it is exposed to air, glue’s water component quickly evaporates into air through a process of oxidation. After glue completes its solidification, it becomes very difficult to wash the glue out.

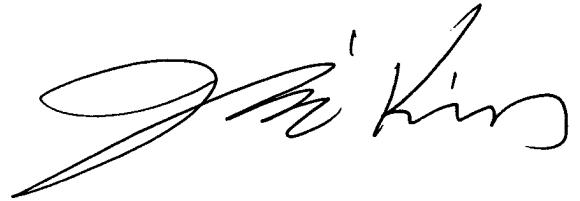

-Even if very small amount of glue component remains at the fluid dispersing holes, glue's solidification will seal those openings. Unless those glue seals are removed, it is virtually impossible to use the applicator again.

-All of patented fluid applicators carry this defect that their designs do not allow an easy access of cleansing devices to enter and remove remaining glue components after usage.

I hereby request the examiner to please take above materials to his/her consideration.

Sincerely,

Jin Young Kim

Application Title: Nozzle Comb

Application Number: 10/189.844

Applicant: Jin Young Kim

Contact Phone Number: 1-917-518-5149

### **Explanation**

Claim 1: Because coloring fluid consists mainly of glue, I designed my invention in such way that the process of fluid dispersing is more efficient and less time-consuming than other applicators. Each individual tooth is cut open parallel to tooth's height that the slot measures from 3/10 of tooth's height to the end of the tip, enabling 180 degrees to 360 degrees fluid dispersing.

Claim 2: If time spent on coloring elongates, the heat produced from head and oxidation quickly solidify the mixture. Therefore, I structured the teeth in three layers of a zigzag layout to reduce this time consuming process. With such design, one combing of this applicator is much more efficient than three combing of one layered applicators. First, each individual tooth of my applicator disperses more fluid than others in a given time. Second, one combing coats same hair three times that it is much less-time consuming and much more convenient than running an applicator three times.

### **Comparison with other patents**

A. U.S. 5.937.865, Dhaliwal- Drawing Fig 2 and Fig4 show that although his placement of opening is similar, opening's shape (hole) and its function are completely different from that of my invention.

(For reference- see Fig 2, Fig3, Fig5, Fig7, Fig9, Fig10, and Fig11 of my application)

B. U.S. 6.260.557, Yarbrough- After examining Fig5-4a, Fig6-4b, Fig7-4c, and Fig8, I found them irrelevant to my invention.

C. U.S. 6.457.476, Emer- I arrived at same conclusion after examining Fig7, Fig8 and Fig11 of the application.

D. U.S. 6.460,546, Sofer- After examining Fig5A-A2, Fig2-20, Fig3-20, Fig2-18, and Fig3-18, I concluded that the slot is spatially limited to the tip of a tooth.

\* An opening in my application covers 70% of the height of the tooth.

(For Reference: see Fig2, Fig4, Fig5, Fig6, Fig7, and Fig 10)
